**An oral liquid supplement to reduce the risk Milk Fever in cattle and hypocalcaemia in sheep**

Features	Benefits
Organically bound calcium	Ensures rapid absorption of calcium within minutes of feeding yet the slow release formula produces elevated calcium serum levels for approximately 12 hours.
High Calcium levels per bottle (50g/bottle)	Significantly higher than the amount secreted in the cow milk and is five times higher than a calcium-chloride bottle.
Exceptionally palatable	Readily accepted and swallowed by the cow unlike calcium-chloride products which have a strong acidic taste.
Well tolerated by the mucous membrane	Will not burn the mucous membrane, calcium chloride has a tendency to cause burns to the mucosa of the upper digestive tract.
Easily Metabolised	After they have been metabolised, the organic calcium carriers perform a significant role as buffers against possible acidosis.
Glucoplastic energy in the form of Propionate and acetate	Provides significant levels of readily available energy in the form of absorbable energy (3.1MJ/bottle).
Unique soft bottle design	Ensures quick and easy oral application.

**When to use:** Cattle – use Bovical immediately before or after calving and before recumbency.

Sheep – Use Bovical immediately on appearance of hypocalcaemia symptoms.

**DO NOT USE AS A TREATMENT**

**Unit Size:** 500ml Plastic Drenching Bottle.

**Application:** Cattle – 500ml.  
Sheep -100ml.
